

# Aquaforce 15000

Mobile water treatment unit  
for humanitarian emergency

User manual

# AQUAFORCE

Mobile Treatment water unit used in densely populated area or refugee camps, the Aquaforce 15000 supplies 2l of potable water per day, suitable for 15 000 people.

2

Thanks to its optimized weight, its ergonomy, its robustness, its packaging and to its ease of operation, Aquaforce 15 000 can easily be transported.

LOGISTIC

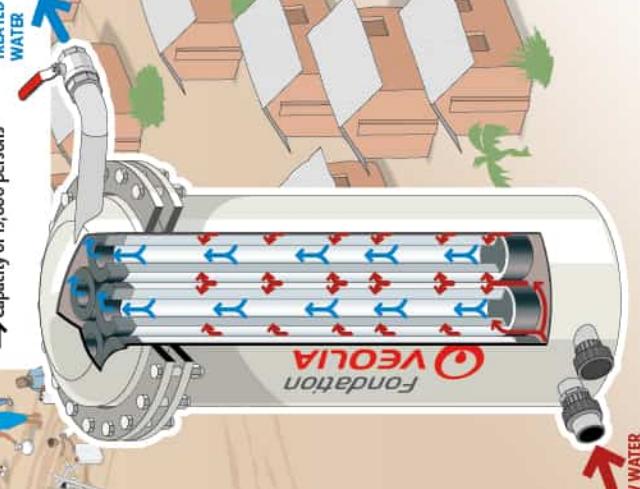

## 5 DISTRIBUTION

- 4.5 t of material
- 25 m<sup>3</sup> in volume
- 1 day 1/2 of installation

## FILTRATION

UF membranes remove all of the suspended solids as well as the majority of the pathogens present in the water.

- 20 liters per day and per capita
- Capacity of 15,000 persons

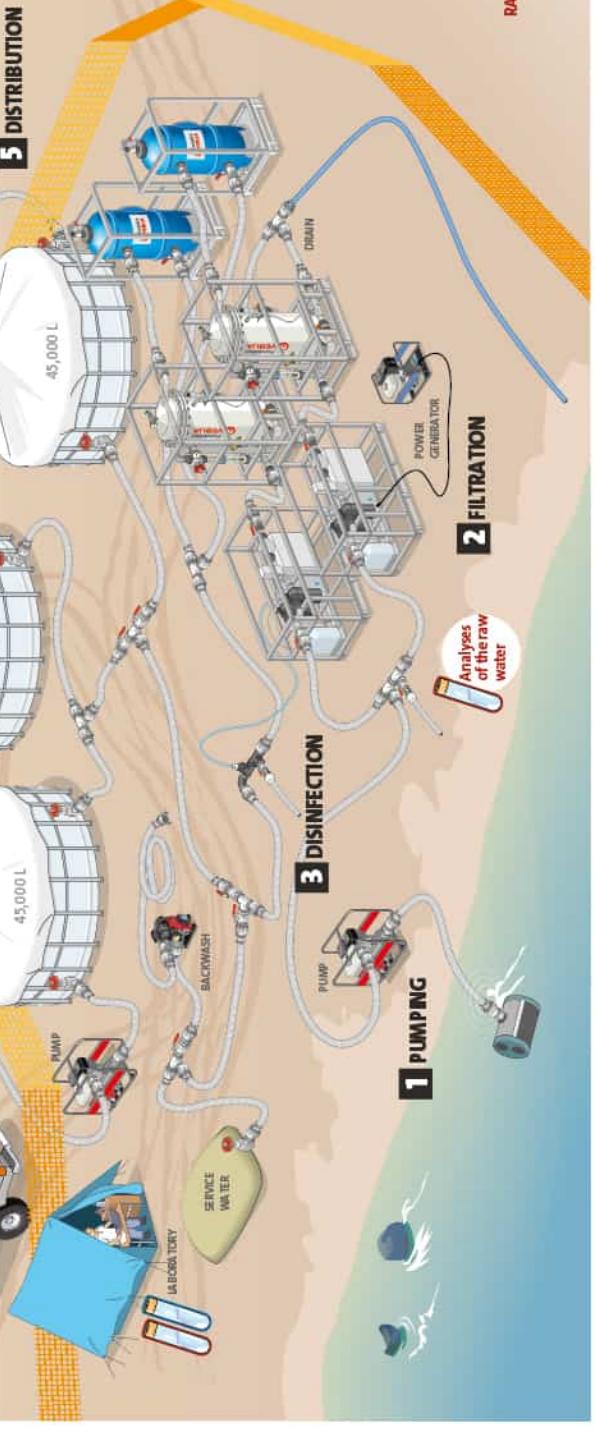

## 5 DISTRIBUTION

## 4 STORAGE

45,000 L

45,000 L

45,000 L

Analyses of the raw water

Analyses of the treated water

## 5 DISTRIBUTION

# Summary

<b>I. Selection of the production site .....</b>	6
<b>II. Installation and operation .....</b>	7
Presentation of the components .....	7
Site preparation .....	10
Motopumps: filling of consumables .....	11
The power generator .....	13
Installation of the raw water pump and of the strainer .....	13
- Tips for getting started: fire connections and teflon fitting.....	13
- Installation of the raw water pump .....	14
- Immersion of the strainer.....	15
Connection between pre-filtration and ultrafiltration modules.....	16
First filtration: membranes rinse .....	17
- Installation of the drain line .....	17
- Valves position .....	18
- Start of rinse .....	18
- Membrane integrity check.....	19
- End of rinse .....	19
Preparation of the activated carbon filters .....	20
First cleaning of the carbon filters .....	21
- Connection to the ultrafiltration modules "upside down" and to the drain.....	21
- Valves position .....	22
- Start of backwash.....	23
- End of backwash.....	24
Connection of the chlorine injection line / sampling.....	25
Installation of the service water tank .....	27
Filling of the service water tank and flow adjustment .....	28
Installation of the water storage network.....	29
Installation of the semi-rigid storage tanks .....	30
Installation of the distribution network.....	33
Electric connections .....	34
Final set-up .....	35
<b>III. Chemistry .....</b>	36
Impact of chlorine on the drinkable nature of the water .....	36
How to chlorinate water? .....	36
1% chlorine stock solution in the laboratory (10 grams per liter) .....	37
Chlorine demand .....	39
The dosing pump.....	43
Priming the dosing pump.....	44
Calculation of the volume to be injected by the dosing pump .....	47
To sum up.....	49
Preparation of the stock solution of 10 L at 1% .....	50
Start of the dosing pump and start of production .....	51

<b>IV. Operation and monitoring</b>	52
Monitoring - Summary table	52
Every morning	53
Every hour	54
Every 2 hours	55
Every truck	55
Every noon	55
Every evening	56
3 times a week	56
Every week	57
<b>V. Operation sheets</b>	58
Start of production	58
- Valves position	58
- Start of production	59
Cleaning the prefilters	60
Ultrafiltration modules backwash	61
- Position of the valves	61
- Backwash start-up	62
- Backwash steps to repeat	63
- End of backwash	64
Chemical cleaning of the ultrafiltration modules	65
- Valves position and chlorine solution introduction	65
- Chemical backwash start-up	66
- End of backwash	67
Washing the carbon filters	68
- Connecting to the ultrafiltration modules "upside down"	68
- Position of the valves	70
- Starting the backwash	71
- End of backwash	72
Water trucking - chlorination	73
Bacteriological analyses	74
<b>VI. Appendices</b>	79
Measuring turbidity	79
Operation of the ultrafiltration modules	80

Operation of the submersible pump	82
Operation of separate production lines	83
Possible set-ups	85
Troubleshooting	86
Reminder of SPHERE recommendations	88
Separation	89
Caractéristiques des membranes S 10 N	90
Disassembly, Cleaning and storage of station	91

**Aquaforce 15000** is a stand-alone drinkable water production kit, made for humanitarian emergencies or post-crisis management. It's using an ultrafiltration process. Membrane filtration allows to remove all Total Suspended Solid (TSS), as well as the majority of pathogens that can be found in the water. Following the filtration, the injection of a chlorinated solution allows **to secure the quality of the delivered water**. Therefore, the delivered water is compliant with SPHERE standards and the norms of the World Health Organisation.

Aquaforce 15000 is able to treat a wide range of raw water, but cannot treat salted or brackish water. The production flow rate depends on the water turbidity, with a maximum of 15 m<sup>3</sup>/h **allowing to supply drinking water up to 15000 persons per day** (20 L/day/person). Aquaforce 15000 is made of three modules (pre-filtration, ultrafiltration, carbon filter) and includes a storage and manifold distribution system. The kit also **allows to perform treated water trucking** to supply flexible tanks and distribution manifolds near dispersed populations.

# Selection of the production site

Once assembled, the unit is very difficult to disassemble, move or even repair the various items. Thus, **great care must be taken in selecting the raw water, in choosing the installation site, and in the prerequisite works prior to installation.**

## CHECK LIST

- **What's the population to be supplied with?**  
**Is the foreseen equipment sufficient?**

- Required quantity = minimum of 15 l/day/inhabitant (SPHERE norms)
- Distance from the population to the distribution point <500m

- **Is the resource adapted to my needs?**

- Flow rate > 15 m³/h
- pH between 6.5 and 8.5
- Conductivity < 1200 µS/cm

- **Is the site accessible and accepted by all the stakeholders?**

- Local authorities / Property owner
- Users
- Tanker trucks
- Fuel and reagent supply

- **Is the site healthy?**

- Rain water drainage
- Filter backwash water drainage
- General aspect

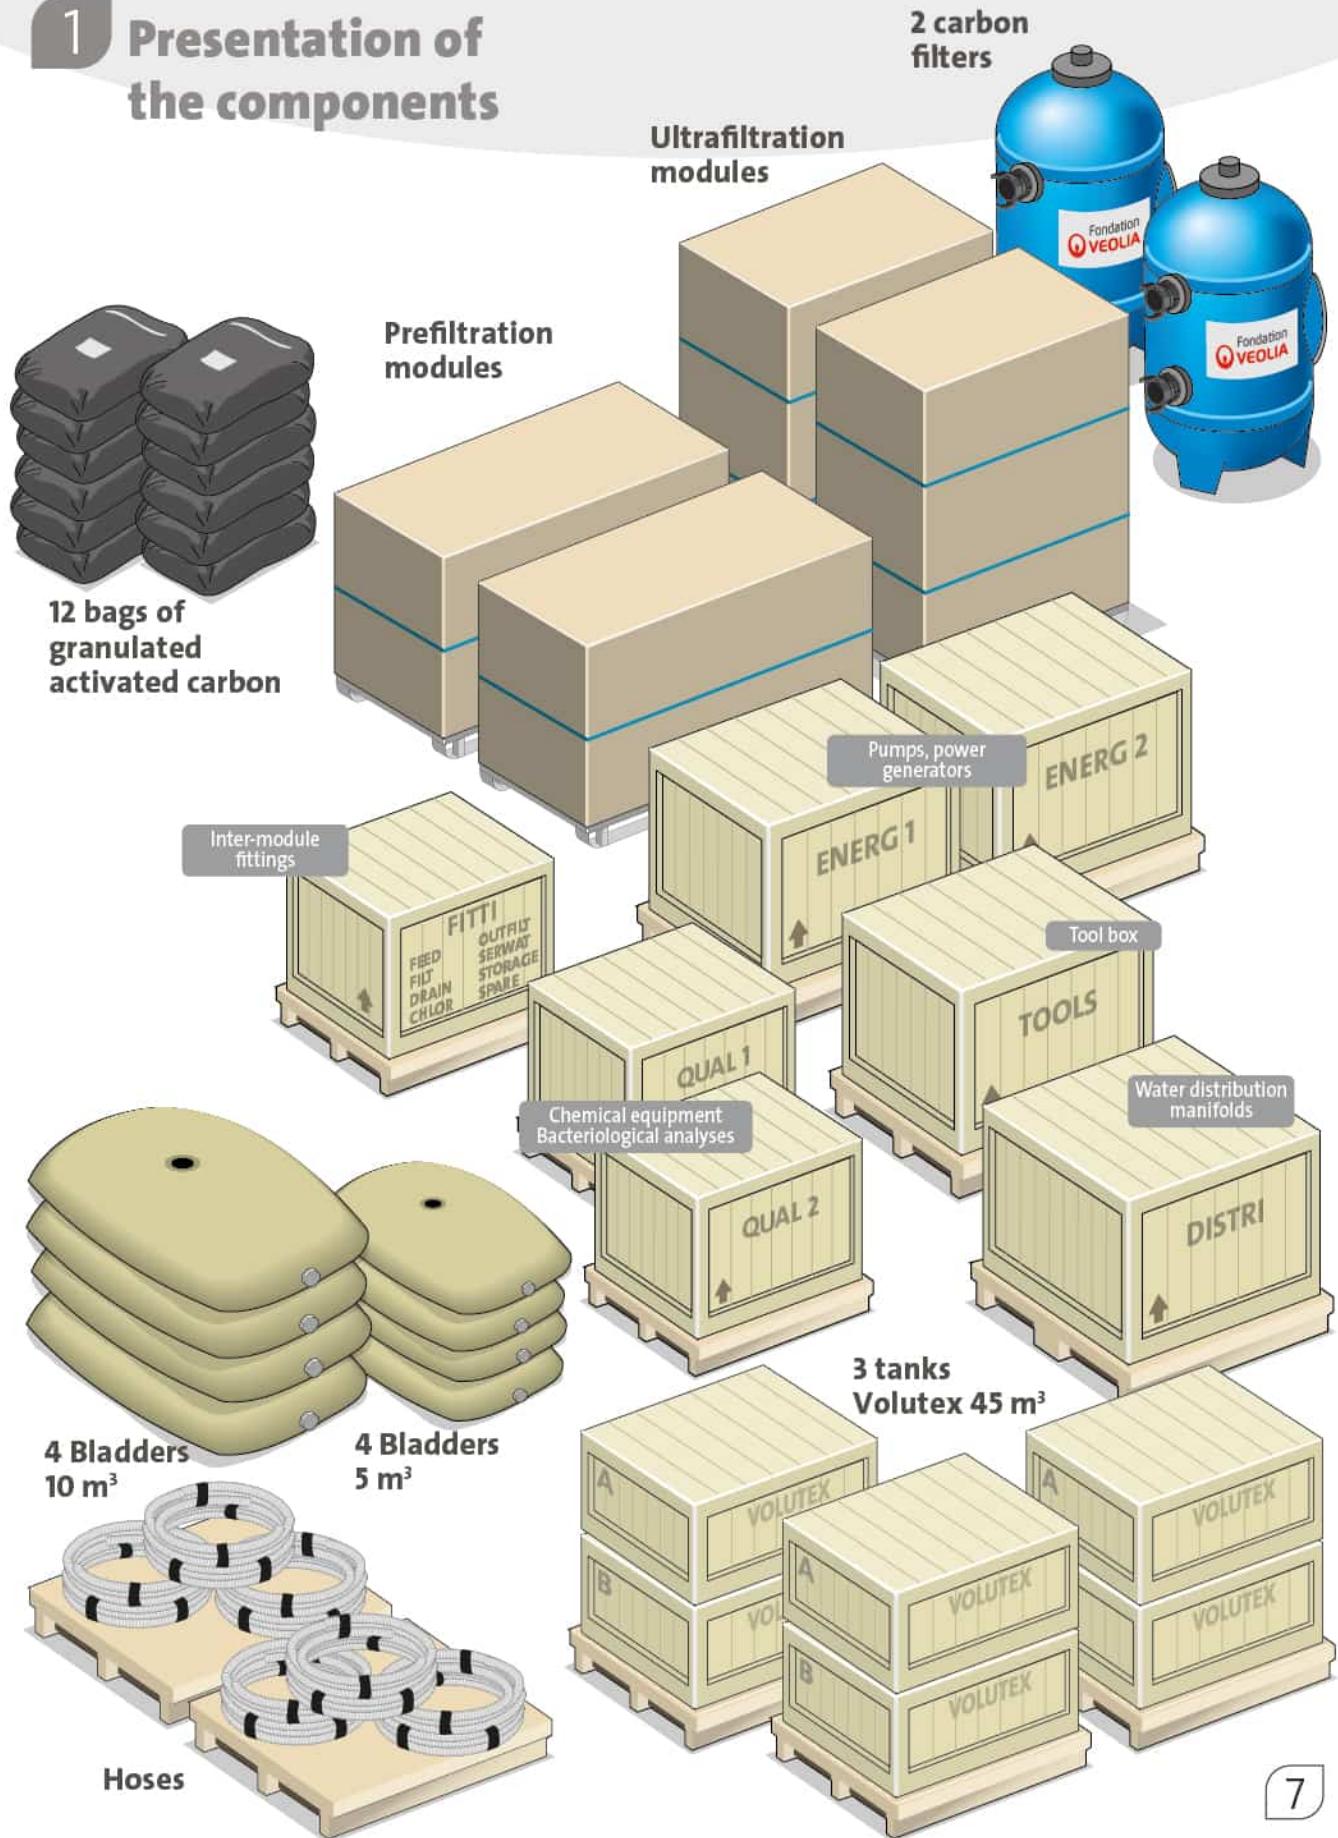

- **Is safety ensured for personnel and equipment?**

- Myself and my colleagues
- Equipment and stock (Day/Night)
- Population and users
- Natural risks (in particular flooding risks)
